TEAM SELLM · TACTO NEGOTIATION ARENA

Our AI never says a number.

An LLM reads the supplier.
Deterministic code does the math, writes the offer, closes the deal.

61.5 → 81.1

mean score on the 10 practice cases
kit agent → our agent

HOW IT DECIDES

The LLM gives instructions. A deterministic engine negotiates.

LLM PLANNER

Reads the supplier's letters, notes and news

Says which terms it values and which cost it blames - with a quote as evidence

instructions, no numbers

DETERMINISTIC ENGINE

- ✓ checks every instruction against its source
- ✓ prices every offer with the arena's own cost function
- ✓ cites one verified fact per e-mail
- ✓ writes the e-mail from a fixed template

0

numbers written by the LLM

1

LLM call per supplier, before the first offer

71.6 vs 72.9

LLM-written e-mails scored lower - and stopped being repeatable

HOW WE TESTED

Our own data set. Our own arena.

DATA SET

521 negotiations saved in full, with the supplier's reasons

1,100 real supplier replies

46 supplier dossiers from the data

LOCAL ARENA

A twin of every supplier we met, calibrated to its real best deal, plus invented suppliers for all 7 case types - with the clock, timeouts and the 8-minute wave

1.85 % mean error against 1,100 real replies

18,444

negotiations in one night's sweep - free, no quota

0

crashes in 816 stress negotiations

1

real session per idea - only the winners

HOW WE WORKED

Six eyes, three agents, one memory

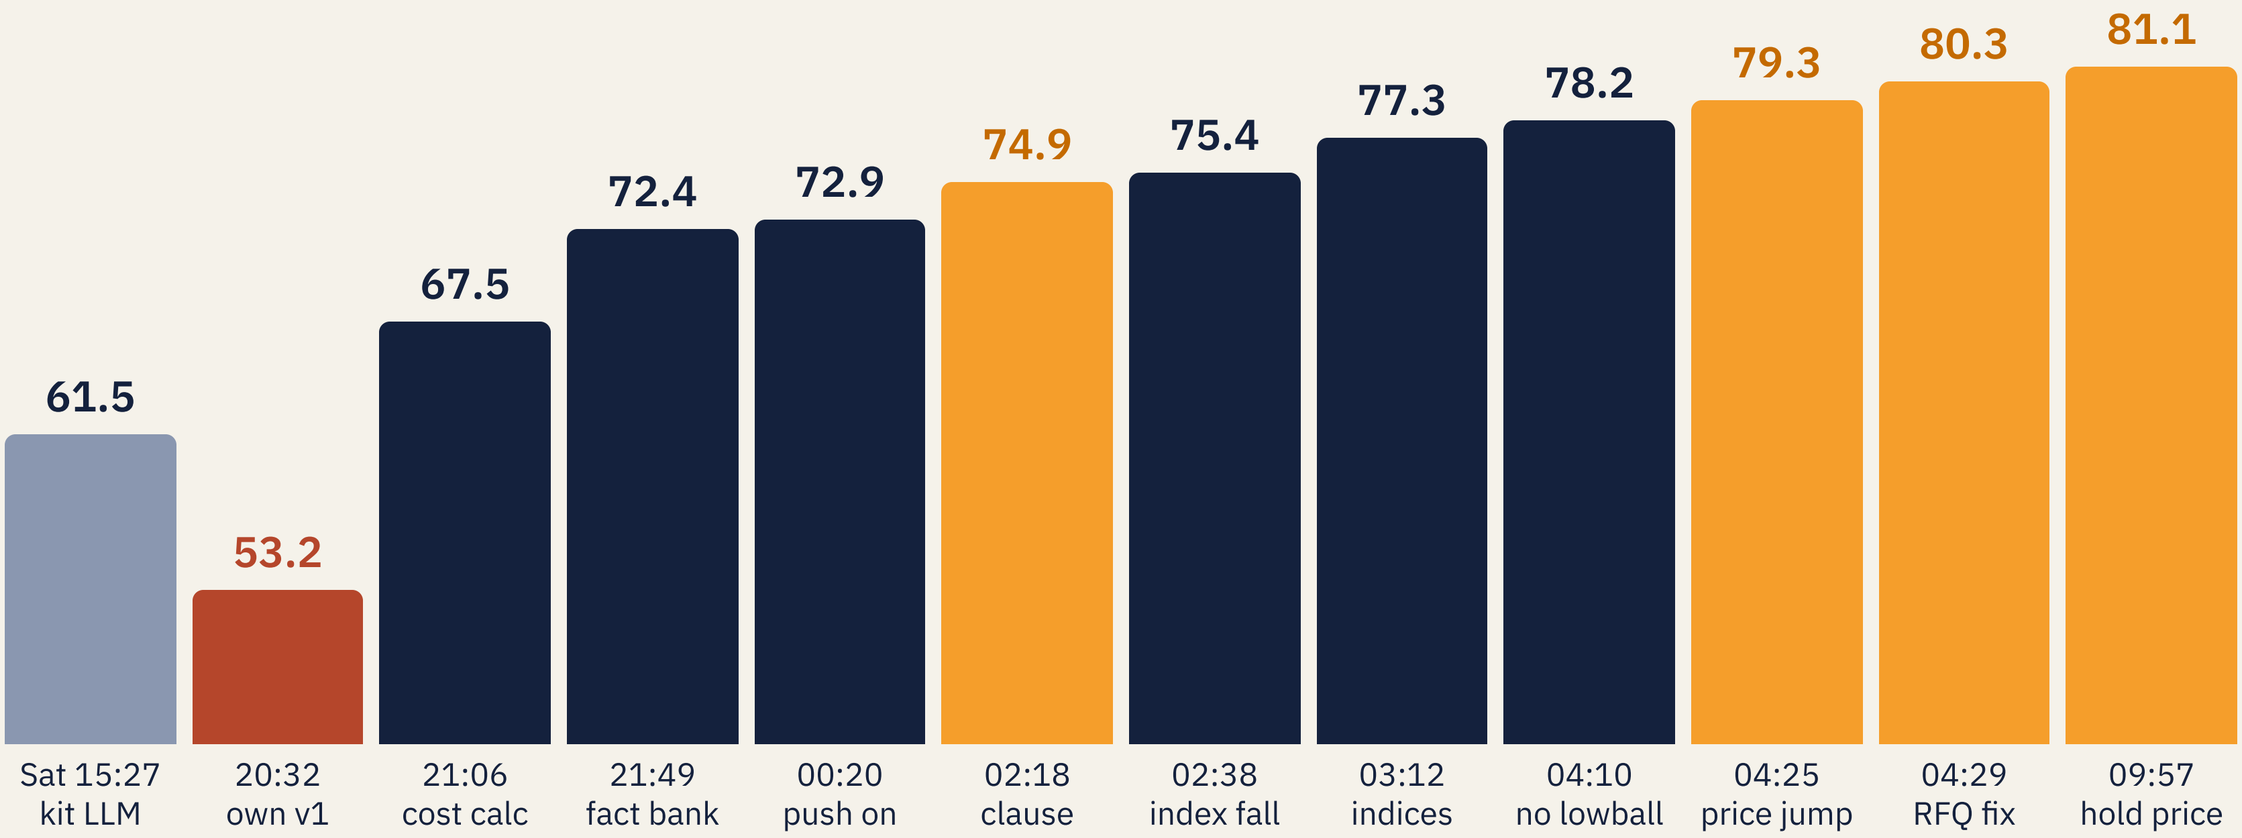

- A — Amiad's agent
- J — Jonathan's agent
- O — Omar's agent

WHAT IT BROUGHT US

- **Constant improvement**
- **No forgetting**
- **No getting in each other's way**

18 hours, 12 measured versions

mean score × 100, all 10 practice cases

Orange = moves no kit agent makes · red = our first own agent lost 8 points: structure before price was the lesson · 81.1 measured three times (09:57, 10:11, 10:22) - it is the agent we submit
